Clustering

May 24, 2021

Note: You need to submit the assignment to be graded, and passing the validation button's test does not grade the assignment. The validation button's functionality is exactly the same as running all cells.

If you plan to run the assignment locally: You can download the assignments and run them locally, but please be aware that as much as we would like our code to be universal, computer platform differences may lead to incorrectly reported errors even on correct solutions. Therefore, we encourage you to validate your solution in Coursera whenever this may be happening. If you decide to run the assignment locally, please: 1. Try to download the necessary data files from your home directory one at a time, 2. Don't update anything other than this Jupyter notebook back to Coursera's servers, and 3. Make sure this notebook maintains its original name after you upload it back to Coursera.

```
[6]: %matplotlib inline
%load_ext autoreload
%autoreload 2

import matplotlib.pyplot as plt
import numpy as np
import seaborn as sns
import pandas as pd
from scipy.cluster import hierarchy
from sklearn.cluster import KMeans
from sklearn.metrics import silhouette_score
```

1 *Assignment Summary

You can find a dataset dealing with European employment in 1979 at http://www.dm.unibo.it/~simoncin/EuropeanJobs.html. This dataset gives the percentage of people employed in each of a set of areas in 1979 for each of a set of European countries. Notice this dataset contains only 26 data points. That's fine; it's intended to give you some practice in visualization of clustering.

1. Use agglomerative clustering to cluster this data. Produce a dendrogram of this data for each of single link, complete link, and group average clustering. You should label the countries on the axis. What structure in the data does each method expose? You should see dendrograms that "make sense" (at least if you remember some European history), and have interesting differences.

2. Using k-means, cluster this dataset. What is a good choice of k for this data and why?

Attention: After finishing this notebook, you will need to do a follow-up quiz as well. The overall grade for this asiggnment is based on this notebook and the follow-up quiz.

2 0. Data

2.1 0.1 Description

You can find a dataset dealing with European employment in 1979 at http://www.dm.unibo.it/~simoncin/EuropeanJobs.html. This dataset gives the percentage of people employed in each of a set of areas in 1979 for each of a set of European countries. Notice this dataset contains only 26 data points. That's fine; it's intended to give you some practice in visualization of clustering.

    X = df[feature_cols].values
    Y = df['Country'].tolist()
```

3 1. Agglomerative Clustering

4 Task 1

Write a function $single_linkage$ that produces a single-link agglomerative clustering. This function should take the data matrix X as input, which is a numpy array with the shape of (N,d) where N is the number of samples and d is the number of features. The output of the function should be a linkage matrix. Use the Euclidean distance as a metric.

You may find scipy's hierarchical clustering methods (https://docs.scipy.org/doc/scipy/reference/cluster.hierarchy. useful here. The utilization of the optimal_ordering option makes interpretations of the resulting trees an easier job.

```
[10]: def single_linkage(X):

"""

Produce a single-link agglomerative clustering.

Parameters:

X (np.array): A numpy array of the shape (N,d) where N is the independent of samples and d is the number of features.

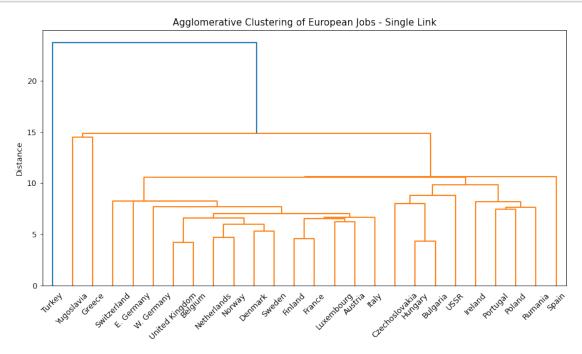

Returns:

single_link (np.array): The single-link agglomerative in the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the shape (N,d) where N is the independent of the independent of
```

```
[11]: single_link = single_linkage(X)
assert single_link[:,2].min().round(3) == 4.234
```

```
[12]: # Next, we will plot the dendogram for the first task.
```

```
[13]: single_link = single_linkage(X)
   plt.figure(figsize=(12,6), dpi=90)
   plt.ylabel("Distance")
   plt.title("Agglomerative Clustering of European Jobs - Single Link")
   dn_single = hierarchy.dendrogram(single_link, labels=Y)
```

5 Task 2

Write a function complete_linkage that produces a complete-link agglomerative clustering. This function should take the data matrix X as input, which is a numpy array with the shape of (N,d) where N is the number of samples and d is the number of features. The output of the function should be a linkage matrix. Use the Euclidean distance as a metric.

You may find scipy's hierarchical clustering methods (https://docs.scipy.org/doc/scipy/reference/cluster.hierarchy. useful here. The utilization of the optimal_ordering option makes interpretations of the resulting trees an easier job.

```
[14]: def complete_linkage(X):
    """

Produce a complete-link agglomerative clustering.

Parameters:
    X (np.array): A numpy array of the shape (N,d) where N is the

→number of samples and d is the number of features.
```

```
Returns:

comp_link (np.array): The complete-link agglomerative

clustering of X encoded as a linkage matrix.

"""

# your code here

comp_link = hierarchy.linkage(X, method='complete', metric='euclidean', □

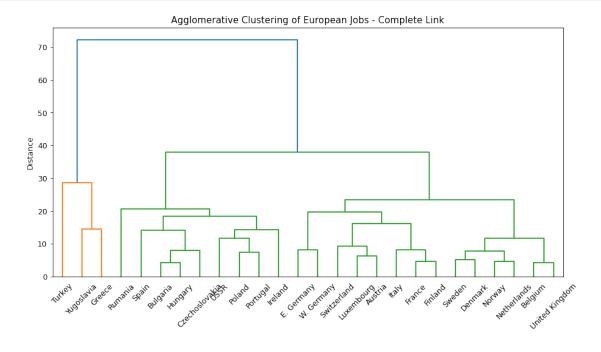

optimal_ordering=True)

return comp_link
```

```
[15]: comp_link = complete_linkage(X)
assert comp_link[:,2].max().round(3) == 72.278
```

[16]: # Next, we will plot the dendogram for the second task.

```
[17]: complete_link = complete_linkage(X)
    plt.figure(figsize=(12,6), dpi=90)
    plt.ylabel("Distance")
    plt.title("Agglomerative Clustering of European Jobs - Complete Link")
    dn_complete = hierarchy.dendrogram(complete_link,labels=Y)
```

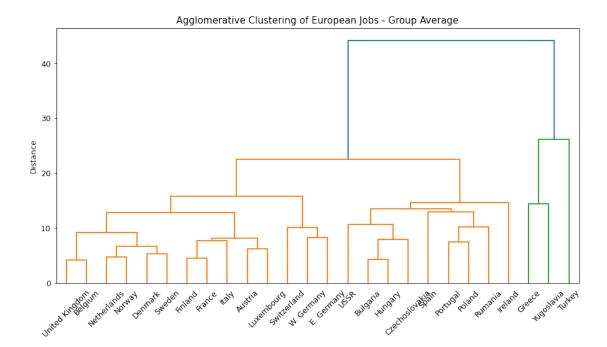

6 Task 3

Write a function $group_avg_linkage$ that produces an average-link agglomerative clustering. This function should take the data matrix X as input, which is a numpy array with the shape of (N, d) where N is the number of samples and d is the number of features. The output of the function should be a linkage matrix. Use the Euclidean distance as a metric.

You may find scipy's hierarchical clustering methods (https://docs.scipy.org/doc/scipy/reference/cluster.hierarchy. useful here. The utilization of the optimal_ordering option makes interpretations of the resulting trees an easier job.

```
[20]: def group_avg_linkage(X):
          Produce an average-link agglomerative clustering.
              Parameters:
                       X (np.array): A numpy array of the shape (N,d) where N is the
       \rightarrownumber of samples and d is the number of features.
              Returns:
                       avg link (np.array): The average-link agglomerative clustering
       \hookrightarrow of X encoded as a linkage matrix.
          11 11 11
          # your code here
          avg_link = hierarchy.linkage(X, method='average', metric='euclidean', u
       →optimal ordering=True)
          return avg_link
[21]: avg_link = group_avg_linkage(X)
      assert avg link[:,2].max().round(3) == 44.172
[22]: # Next, we will plot the dendogram for the third task.
[23]: average_link = group_avg_linkage(X)
      plt.figure(figsize=(12,6), dpi=90)
      plt.ylabel("Distance")
      plt.title("Agglomerative Clustering of European Jobs - Group Average")
      dn average = hierarchy.dendrogram(average link,labels=Y)
```

7 2. K-Means Clustering

In this part, we perform the K-Means clustering algorithm on the dataset, and evalute the effect of the parameter k (the number of clusters) on the outcome.

For this, we use the KMeans class from sklearn.cluster. You should familiarize yourself with this class. You can find the documentation of it here: https://scikitlearn.org/stable/modules/generated/sklearn.cluster.KMeans.html

In the following code, we run the K-Means algorithm for $2 \le k \le 25$ clusters.

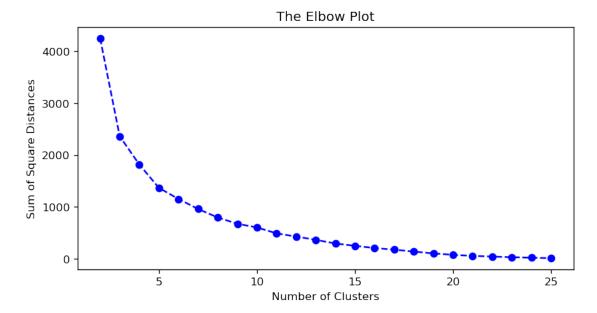

Attention: Although you are not implementing this part, for the follow-up quiz of this assignment, you will need to come back here, write some code and do some calculations to get the answer of some questions in the quiz. For now, try to read the documentation for the KMeans class and try to understand what the following code is doing.

```
[24]: k_list = list(range(2,26))
k_inertias = []
k_scores = []
model_list = []
for k in k_list:
    model = KMeans(n_clusters=k, random_state=12345).fit(X)
    model_list.append(model)
    cluster_assignments = model.labels_
    score = silhouette_score(X, cluster_assignments, metric='euclidean')
    inertia = model.inertia_
    k_scores.append(score)
```

```
k_inertias.append(inertia)
```

Now, we plot the sum of square distances of samples to their closest cluster center as a function of k, the number of clusters.

```
[25]: plt.figure(figsize=(8,4), dpi=120)
    plt.title('The Elbow Plot')
    plt.xlabel('Number of Clusters')
    plt.ylabel('Sum of Square Distances')
    _=plt.plot(k_list, k_inertias,'bo--')
```

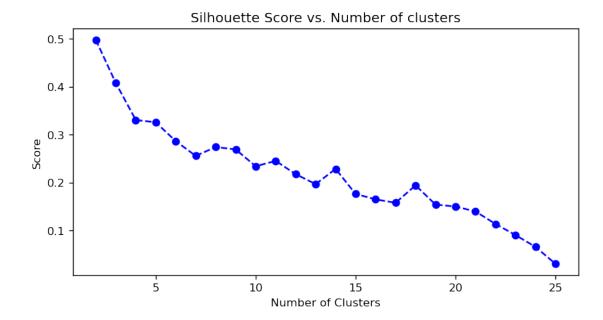

Look at the above *Elbow plot*. Based on this plot, what do you think is a reasonable choice of k?

Next, we plot the so called "silhouette" score for the result of the K-Means clustering algorithm for the values of k we implemented above. The silhouette score is a measure of how similar an object is to its cluster compared to other clusters.

- Try to learn how the silhouette score is defined. For instance, you can look at this Wikipedia page: https://en.wikipedia.org/wiki/Silhouette_%28clustering%29.
- What is the range of the silhouette score?
- Is a larger value of the silhouette score better or worse?

```
[26]: plt.figure(figsize=(8,4), dpi=120)
    plt.title('Silhouette Score vs. Number of clusters')
    plt.xlabel('Number of Clusters')
    plt.ylabel('Score')
    _=plt.plot(k_list, k_scores, 'bo--')
```

Based on the silhouette measure, what do you think is a reasonable value for k? Is this the same value that the above elbow plot suggests? Why do think so?

[]:
